

# WATER FOR FISH: SUSTAINABLE INLAND FISHERIES

- How can agriculture and other land uses be incentivized to reduce their adverse impacts on inland waters and inland fisheries and rather provide opportunities to enhance inland fisheries?
- How can water allocations be balanced equitably between ecosystem service provisioning, such as between fisheries, power generation, irrigation, etc.
- What water resource measures are needed to address climate change impacts to water provisioning (e.g., for agriculture, drought mitigation) and how will these measure impact fisheries?
- How can protection of inland fish habitats and species be integrated into land and water use planning?
- What are our opportunities for having these discussion points accepted by the wider sector, so these conversations can continue?
